Common Questions and Answers from Ms. Foglia's Cloning Practice Materials

Below are some typical questions students encounter, along with explanations aligned with the Ms. Foglia answer key.

Question 1: What is the primary purpose of somatic cell nuclear transfer?

Answer:

The primary purpose of somatic cell nuclear transfer (SCNT) is to create a genetically identical organism or embryo by transferring a somatic cell nucleus into an enucleated egg cell. This technique is used for reproductive cloning, as exemplified by Dolly the sheep, and for therapeutic cloning to produce embryonic stem cells.

Question 2: How does gene cloning differ from reproductive cloning?

Answer:

Gene cloning involves creating multiple copies of a particular gene or DNA fragment, often using vectors like plasmids in bacteria. It is a molecular technique used for research, medicine, and biotechnology. Reproductive cloning, on the other hand, involves creating a whole organism that is genetically identical to the donor organism, such as Dolly the sheep.

Question 3: What are some ethical issues associated with cloning?

Answer:

Ethical issues include concerns about the potential for human cloning and its implications for identity and individuality, the welfare of cloned animals, the possibility of cloning for organ harvesting, and the impact on genetic diversity. Many argue that cloning could lead to social and moral dilemmas that require careful regulation.

Question 4: Describe the role of plasmids in gene cloning.

Answer:

Plasmids are small, circular DNA molecules found in bacteria that can replicate independently. In gene cloning, scientists insert a gene of interest into a plasmid, creating recombinant DNA. This plasmid is then introduced into bacteria, which multiply and produce large quantities of the gene or protein encoded by the inserted DNA.

Question 5: What is the significance of Dolly the sheep in cloning history?
