Introduction to Circulatory and Respiratory Systems Vocabulary

The circulatory system (also called the cardiovascular system) and the respiratory system work in tandem to ensure oxygen reaches tissues and carbon dioxide is expelled from the body. A solid grasp of their key vocabulary is foundational to understanding human physiology and the pathophysiology of various diseases. This review aims to dissect 38 essential terms, providing clear definitions, contextual explanations, and illustrative examples where appropriate.

The Circulatory System Vocabulary

The circulatory system comprises the heart, blood vessels, and blood. It functions primarily to transport nutrients, hormones, oxygen, and waste products throughout the body. Here are key terms you should become familiar with:

Heart-Related Terms

- Atrium: The upper chamber of the heart that receives blood returning to the heart. The heart has two atria: right and left.
- Ventricle: The lower chamber of the heart that pumps blood out to the lungs or the rest of the body.
- Aorta: The main artery that carries oxygen-rich blood from the left ventricle to the body.
- Pulmonary Artery: Carries oxygen-poor blood from the right ventricle to the lungs.
- Pulmonary Vein: Returns oxygen-rich blood from the lungs to the left atrium.
- Valves (e.g., Tricuspid, Bicuspid/Mitral, Aortic, Pulmonary): Prevent backflow of blood, ensuring unidirectional flow within the heart.

Blood and Blood Components

- Red Blood Cells (Erythrocytes): Cells responsible for transporting oxygen via hemoglobin.
- White Blood Cells (Leukocytes): Cells involved in immune responses.
- Platelets (Thrombocytes): Cell fragments that aid in blood clotting.

QuestionAnswer What is the primary function of the circulatory system? The primary function of

the circulatory system is to transport blood, nutrients, oxygen, and hormones throughout the body and remove waste products. Name the main components of the respiratory system. The main components of the respiratory system are the nose, pharynx, larynx, trachea, bronchi, lungs, and alveoli. What is the role of the alveoli in the respiratory system? Alveoli are tiny air sacs in the lungs where gas exchange occurs, allowing oxygen to enter the blood and carbon dioxide to be removed. Define 'blood pressure' and its significance. Blood pressure is the force exerted by circulating blood on the walls of blood vessels; it is vital for maintaining adequate blood flow to organs and tissues. What is the function of red blood cells in the circulatory system? Red blood cells carry oxygen from the lungs to body tissues and return carbon dioxide from tissues to the lungs for exhalation. Explain the term 'respiration' in the context of the respiratory system. Respiration is the process of gas exchange where oxygen is taken into the body and carbon dioxide is expelled, primarily occurring in the lungs. What vocabulary terms are essential to understanding the flow of blood through the heart? Key terms include atria, ventricles, valves, aorta, pulmonary arteries, and vena cava, which describe the chambers, pathways, and structures involved in blood circulation.
