Step-by-Step Procedure for the Cherry Coke Distillation Lab

Preparation Phase

- Set up the distillation apparatus on a stable, heat-resistant surface.
- Ensure all glassware is clean and dry to prevent contamination.
- Pour approximately 200-250 mL of cherry coke into the distillation flask.
- Insert the thermometer into the flask, ensuring it does not touch the liquid directly but is immersed in the vapor space.
- Connect the condenser to the distillation flask and secure it with clamps.
- Attach the rubber tubing from the condenser to the ice bath to facilitate condensation.

Distillation Process

- Turn on the heat source gradually to avoid sudden boiling or bumping.
- Monitor the temperature carefully; expect the initial boiling point to be around 100°C, but note that the mixture contains sugars and flavorings that may affect boiling behavior.

- As vapor begins to form, it travels through the condenser where it cools and turns back into liquid form.
- Collect the condensed liquid in the receiving flask, labeling it as the "distillate."
- Continue heating until the temperature reaches a point where no more distillate is collected, indicating that the main volatile components have been separated.

Post-Distillation Analysis

- Observe and record the volume of the collected distillate.
- Compare the original cherry coke with the distillate in terms of appearance, smell, and taste (if appropriate and safe).
- Optional: Use pH test strips to analyze the acidity of the distillate versus the original beverage.
- Discuss the separation of components based on their boiling points and the presence of non-volatile ingredients like sugars.
