Understanding Water on Earth

Overview of Earth's Water Distribution

Earth is often called the "Blue Planet" because of its abundant water coverage. Approximately 71% of Earth's surface is covered by water, yet only a small fraction of this water is accessible for human use. The distribution of water among various reservoirs includes:

- **Oceans:** About 97.5% of all water on Earth is contained in oceans as saltwater.
- **Freshwater:** Only about 2.5% of Earth's water is freshwater, which is essential for most life forms.
 - **Glaciers and Ice Caps:** Approximately 68.7% of freshwater is stored in glaciers and ice caps.
 - **Groundwater:** Around 30.1% of freshwater exists as groundwater, accessible through wells and aquifers.
 - **Surface Water:** This includes lakes, rivers, and wetlands, making up roughly 0.3% of freshwater resources.

Understanding this distribution helps grasp the importance of conserving and managing water resources effectively.

The Water Cycle

The water cycle, also known as the hydrological cycle, describes the continuous movement of water on, above, and below the Earth's surface. It is fundamental to maintaining life and shaping Earth's

climate.

Key processes in the water cycle include:

- **Evaporation:** Water from oceans, lakes, and rivers turns into vapor due to the Sun's heat.
- **Transpiration:** Water is released from plants into the atmosphere.
- **Condensation:** Water vapor cools and forms clouds.
- **Precipitation:** Water falls from clouds as rain, snow, sleet, or hail.
- **Runoff and Infiltration:** Precipitated water flows over land into bodies of water or penetrates the ground to replenish groundwater.

The water cycle is vital for replenishing freshwater supplies and supporting ecosystems.
