matlab code for boltzmann transport equation

The Boltzmann Transport Equation (BTE) is a fundamental tool in statistical mechanics and condensed matter physics, describing the statistical behavior of particles such as electrons, phonons, or other carriers in a material. It models how these particles move and interact under various external influences like electric fields, temperature gradients, or scattering processes. Developing MATLAB code to solve the BTE is essential for simulating and understanding transport phenomena in semiconductors, thermoelectric materials, and nanostructures. This article provides a comprehensive guide to implementing MATLAB solutions for the BTE, covering theoretical background, numerical methods, and practical coding strategies.

Understanding the Boltzmann Transport Equation

Fundamental Formulation

The Boltzmann Transport Equation is typically written as:

$$\left[\frac{\partial f}{\partial t} + \mathbf{v} \cdot \nabla_{\mathbf{r}} f + \mathbf{F} \cdot \nabla_{\mathbf{k}} f \right] = \text{Collision Term}$$

where:

- $f(\mathbf{r}, \mathbf{k}, t)$ is the distribution function, representing the probability of finding particles at position $\mathbf{r}$ with wavevector $\mathbf{k}$ at time t .
- $\mathbf{v}$ is the particle velocity.
- $\mathbf{F}$ is the external force (like electric or magnetic fields).
- The right-hand side accounts for scattering processes that relax the distribution toward equilibrium.

Steady-State and Simplifications

In many practical applications, steady-state conditions are assumed ($\partial f / \partial t = 0$), and spatial homogeneity is considered ($\nabla_{\mathbf{r}} f = 0$). Under these assumptions, the BTE simplifies to:

$$\mathbf{F} \cdot \nabla_{\mathbf{k}} f = - \frac{f - f_0}{\tau}$$

where:

- f_0 is the equilibrium distribution (e.g., Fermi-Dirac or Bose-Einstein).
- τ is the relaxation time representing scattering.

This simplified form is often used in numerical models for electrical conductivity, thermoelectric effects, and thermal transport.

Numerical Methods for Solving the BTE in MATLAB

Discretization Strategies

To numerically solve the BTE, discretization in momentum space ($\mathbf{k}$) and sometimes real space ($\mathbf{r}$) is necessary. Common approaches include:

- Finite Difference Method (FDM): Discretizes derivatives on a grid in $\mathbf{k}$ -space.
- Monte Carlo Simulations: Stochastic sampling of particle trajectories and scattering events.
- Variational and Iterative Methods: Solving integral equations derived from the BTE.

For MATLAB implementation, finite difference and iterative methods are often more straightforward to code.

Implementation Outline

A typical MATLAB code for BTE involves these key steps:

- Define physical parameters and constants.
- Discretize the $\mathbf{k}$ -space domain.
- Initialize the distribution function.
- Set up the external forces and scattering mechanisms.
- Implement the numerical scheme to update f until convergence.
- Post-process to extract physical quantities such as current, conductivity, or thermal flux.

Step-by-Step MATLAB Code Development

1. Setting Up Parameters and Discretization

Start by defining physical constants and discretizing the momentum space:

```
```matlab

% Physical constants

k_B = 1.38e-23; % Boltzmann constant (J/K)

T = 300; % Temperature in Kelvin

q = 1.6e-19; % Elementary charge (C)

% Discretization parameters

k_max = 1e10; % Max wavevector magnitude (1/m)

N_k = 100; % Number of k-points

k = linspace(0, k_max, N_k); % k-space grid

dk = k(2) - k(1);

% External electric field

E_field = 1e4; % V/m

```
```

This setup creates a linear k -space grid up to a maximum value, suitable for conduction electrons.

2. Equilibrium Distribution Function

Implement the Fermi-Dirac distribution:

```
```matlab

% Fermi energy (example)

E_F = 5e-19; % in Joules
```

% Energy corresponding to k (assuming parabolic band)

m\_eff = 9.11e-31; % effective mass of electron

E\_k = (hbar^2 k.^2) / (2 m\_eff);

% Fermi-Dirac distribution

f0 = 1 ./ (1 + exp((E\_k - E\_F) / (k\_B T)));

...

### 3. Defining the Scattering Mechanism and Relaxation Time

Assuming a constant relaxation time:

```matlab

tau = 1e-14; % Relaxation time in seconds

...

Alternatively, τ can depend on energy or k, which can be incorporated for more accuracy.

4. Solving the BTE: Applying the Relaxation Time Approximation (RTA)

In the RTA, the perturbed distribution function is:

$f = f_0 + \delta f$

where:

$\delta f = -q E \cdot v_k \cdot \tau \frac{\partial f_0}{\partial E}$

Implementing this:

```matlab

% Velocity at each k

hbar = 1.055e-34; % Reduced Planck's constant

```

v_k = (hbar k) / m_eff; % group velocity

% Derivative of f0 with respect to energy

d_f0_dE = - (1 / (k_B T)) f0 . (1 - f0);

% Perturbation to the distribution function

delta_f = q E_field v_k . tau . d_f0_dE;

% Total distribution function

f = f0 + delta_f;

...

```

## 5. Calculating Transport Properties

Compute the current density:

```

```matlab

% Current density

J = q sum(v_k . f dk); % Summation over k-space

% Conductivity

sigma = J / E_field;

fprintf('Electrical conductivity: %.3e S/m\n', sigma);

...

```

Matlab Code for Boltzmann Transport Equation: An Expert Overview

Understanding the behavior of particles—be it electrons in semiconductors, phonons in thermal conductors, or neutral particles in gases—requires a comprehensive grasp of their transport phenomena. The Boltzmann Transport Equation (BTE) is at the heart of this endeavor, providing a statistical framework for describing how particle distributions evolve in space, momentum, and time under various influences. Implementing the BTE computationally is a complex task, but MATLAB offers an accessible and powerful environment for developing numerical solutions. This article aims to provide an in-depth, expert-level exploration of MATLAB code designed for solving the Boltzmann Transport Equation, highlighting its structure, key components, and practical considerations.

Understanding the Boltzmann Transport Equation (BTE)

Fundamentals of the BTE

The Boltzmann Transport Equation is a kinetic equation that describes the statistical behavior of a large ensemble of particles. It accounts for processes such as drift, scattering, and external forces, enabling the calculation of particle distribution functions over time and space.

The general form of the BTE is:

$$\frac{\partial f}{\partial t} + \mathbf{v} \cdot \nabla_{\mathbf{r}} f + \mathbf{F} \cdot \nabla_{\mathbf{p}} f = \left(\frac{\partial f}{\partial t} \right)_{\text{coll}}$$

Where:

- $f(\mathbf{r}, \mathbf{p}, t)$ is the distribution function.
- $\mathbf{v}$ is the particle velocity.
- $\mathbf{F}$ is the external force.
- $\left(\frac{\partial f}{\partial t}\right)_{\text{coll}}$ is the collision integral representing scattering processes.

In many practical applications, the BTE is simplified under steady-state or near-equilibrium assumptions, but even then, solving it numerically remains challenging due to its high dimensionality.

Numerical Approaches to Solving the BTE in MATLAB

Why MATLAB?

MATLAB is particularly suited for solving the BTE because of its powerful numerical capabilities, extensive library of functions, and ease of visualization. Its matrix-oriented architecture simplifies the implementation of discretized equations, allowing researchers and engineers to prototype solutions rapidly.

Key advantages include:

- Built-in solvers for differential equations.
- Easy handling of multi-dimensional arrays.
- Robust visualization tools.
- Rich set of toolboxes for optimization and parallel computing.

Common Numerical Strategies

Several numerical schemes are employed in BTE solutions:

- Discrete Ordinates Method (SN): Discretizes angular variables into finite directions.
- Finite Difference Method (FDM): Approximates derivatives with difference equations.
- Finite Element Method (FEM): Divides the domain into elements and approximates the solution with basis functions.
- Monte Carlo Methods: Use stochastic sampling for particle trajectories.

For MATLAB implementations, the Discrete Ordinates Method combined with finite difference discretization provides a balance between complexity and computational feasibility.

Constructing MATLAB Code for the BTE

Developing MATLAB code for solving the BTE involves several key steps:

- Discretization of Variables
- Initialization of the Particle Distribution
- Implementation of Boundary Conditions
- Formulation of the Numerical Scheme
- Iterative Solution and Convergence Checks
- Post-processing and Visualization

Let's explore each component in detail.

1. Discretization of Variables

The BTE is defined in multiple variables: space, momentum (or energy), and sometimes angular variables. Discretization converts these continuous variables into finite grids.

Spatial Discretization:

- Divide the domain into a grid with points (x_i) , where $(i=1,2,\dots,N_x)$.
- Use uniform or non-uniform spacing depending on the problem.

Momentum/Energy Discretization:

- For particles like electrons, discretize energy (E_j) over a range relevant to the physical system.
- Use techniques such as uniform grids or adaptive grids for better resolution where needed.

Angular Discretization:

- Implement the discrete ordinates method by selecting a set of angular directions (μ_k) , where $(k=1,2,\dots,N_{\theta})$.

Example:

```
```matlab

x = linspace(0, L, Nx); % Spatial grid

E = linspace(E_min, E_max, NE); % Energy grid

mu = cos(linspace(0, pi, N_mu)); % Angular directions

```
```

2. Initialization of the Distribution Function

Set initial conditions based on physical assumptions:

- Equilibrium distribution (e.g., Fermi-Dirac for electrons).
- Boundary-driven distributions (e.g., injected particles at boundaries).

```
```matlab

f = zeros(Nx, NE, N_mu); % Initialize distribution function

% For example, set boundary conditions:

f(1,:,:) = f_boundary_in;

f(end,:,:) = f_boundary_out;

```
```

3. Boundary Conditions

Proper boundary conditions are critical:

- Inflow boundary conditions: Define incoming particle distributions.
- Reflective or absorbing boundaries: Depending on the physical model.

Example implementation:

```

```matlab

% Inflow at x=0

f(1,:,:) = f_incoming;

% Outflow at x=L

% May require special treatment depending on the scheme

...

```

## 4. Numerical Scheme Formulation

At the core, the numerical solution involves discretizing the streaming and scattering terms:

$$\mathbf{v} \cdot \nabla_{\mathbf{r}} f \approx \text{Finite Difference Approximation}$$

For steady-state, the time derivative vanishes, simplifying to:

$$\mathbf{v} \cdot \nabla_{\mathbf{r}} f + \mathbf{F} \cdot \nabla_{\mathbf{p}} f = \left( \frac{\partial f}{\partial t} \right)_{\text{coll}}$$

In MATLAB, this can be implemented as:

```

```matlab

for iter = 1:maxIter

for ix = 2:Nx-1

for ie = 1:NE

```

```
for ik = 1:N_mu

v = velocity(E(ie)); % Define velocity as a function of energy

mu_k = mu(ik);

% Upwind scheme for advection:

if mu_k > 0

df_dx = (f(ix,ie,ik) - f(ix-1,ie,ik)) / dx;

else

df_dx = (f(ix+1,ie,ik) - f(ix,ie,ik)) / dx;

end

scattering_term = compute_scattering(f, ix, ie, ik);

% Update rule:

f_new(ix,ie,ik) = f(ix,ie,ik) - v mu_k df_dx dt + scattering_term dt;

end

end

end

% Check for convergence

if max(abs(f_new - f), [], 'all')
break;

end

f = f_new;

end
```

```
```
```

Note: The above is a simplified illustration. Actual implementation must consider stability, boundary conditions, and the specific scattering mechanisms.

## 5. Iterative Solution and Convergence

Since the BTE is often nonlinear (especially with energy-dependent scattering), iterative methods are employed:

- Source iteration: Repeatedly update the distribution until convergence.
- Accelerated schemes: Use techniques like Anderson acceleration to speed convergence.

Convergence criteria typically involve the maximum change in the distribution function:

```
```matlab
```

```
if max(abs(f_new - f), [], 'all')  
disp('Solution converged');
```

```
break;
```

```
end
```

```
```
```

## 6. Post-processing and Visualization

Once a solution is obtained, MATLAB's visualization tools reveal insights into particle transport:

```
```matlab
```

```
figure;
```

```
imagesc(x, E, squeeze(sum(f, 3))); % Sum over angles for energy distribution
```

```
colorbar;
```

```
title('Particle Distribution across Space and Energy');
```

```
xlabel('Position (x)');
```

```
ylabel('Energy (E)');
```

```
...
```

Additional analyses include calculating current densities, thermal flux, and mean free paths.

Practical Considerations and Advanced Features

- Parallel Computing: MATLAB's Parallel Computing Toolbox can expedite simulations, especially for large grids.
- Adaptive Meshes: Using adaptive discretization enhances accuracy in regions with steep gradients.
- Inclusion of External Fields: Incorporate electric/magnetic fields into the force term.
- Energy-dependent Scattering: Model complex scattering mechanisms like phonon interactions or impurity scattering.
- Verification and Validation: Compare numerical results with analytical solutions or experimental data.
