Common Dissection Questions and External Anatomy Answer Key

To assist in study and dissection, here are typical questions and their detailed answers:

Q1: How can you identify the anterior (front) and posterior (back) ends of the fetal pig?

- Answer: The anterior end is distinguished by the presence of the head, with the snout, eyes, and ears. The posterior end features the tail and anus. The head is oriented toward the top of the dissecting tray, and the tail is toward the bottom.

Q2: Where are the forelimbs and hindlimbs located?

- Answer: The forelimbs are attached near the shoulders, located on the lateral sides of the upper trunk. The hindlimbs are attached near the pelvis at the posterior end of the trunk.

Q3: How do you determine the sex of the fetal pig externally?

- Answer:

- Male: Presence of a small prepuce covering the penis, with the genital papilla located ventral to the anus.

- Female: Vulva is a slit-like opening ventral to the anus, and the genital papilla is located near the vulva.

Q4: What external features can help identify the pig's dorsal (back) from ventral (belly) side?

- Answer: The dorsal side is the pig's back, usually with the backbone visible as a ridge along the top. The ventral side is the underside, with the belly, umbilical cord, and genital openings.

Q5: Describe how to locate the umbilical cord and navel.

- Answer: The umbilical cord is a thick, cord-like structure running from the ventral side of the pig's abdomen, indicating the connection to the placenta during development. The navel is the scar left after the umbilical cord detaches, located centrally on the ventral surface.

Question What are the main external features of a fetal pig used for dissection? The main external features include the snout, ears, eyes, limbs, tail, umbilical cord, and various openings such as the mouth, nostrils, and genital opening. **Answer** How can you identify the anterior and posterior ends of a fetal pig? The anterior end is identified by the presence of the head and snout, while the posterior end is the tail end. The head usually contains the eyes, ears, and mouth, indicating the front. What is the function of the external umbilical cord on a fetal pig? The external umbilical cord connects the pig to the placenta and provides nutrients and oxygen during development; it appears as a small, scar-like structure on the abdomen. How do you distinguish between male and female fetal pigs externally? In female fetal pigs, the urogenital opening is located ventrally near the anus, often with visible nipples, whereas male pigs have a urogenital opening located farther anterior and may have a scrotal swelling. What external features can help identify the dorsal and ventral sides of a fetal

pig? The dorsal side is the pig's back, usually with a series of small bumps called the dorsal spinal ridge, while the ventral side is the belly, which is smoother and contains the abdominal opening. Where are the sensory organs located on the external anatomy of a fetal pig? The sensory organs are located on the head; the eyes are on the sides of the face, the ears are on top of the head, and the nostrils are at the tip of the snout. What external structures are used to determine the orientation during dissection? The head and tail help determine orientation; the snout indicates anterior, while the tail indicates posterior, and the dorsal side is the back, ventral is the belly. Are there any external features that indicate the developmental stage of the fetal pig? Yes, features such as the size of the pig, the development of external genitalia, and the presence of fine hair or hairless skin can indicate the stage of fetal development. Why is it important to carefully examine the external anatomy before internal dissection? Examining the external anatomy helps identify key structures, ensures proper orientation, and prevents damage during internal dissection, leading to a better understanding of fetal pig anatomy.
