Applying the Principles: A Closer Look at Key Topics

Time Value of Money (TVM)

The solutions often involve calculating present and future values using formulas such as:

- $PV = \frac{FV}{(1 + r)^n}$
- $FV = PV \times (1 + r)^n$

where PV is present value, FV is future value, r is the discount rate, and n is the number of periods.

Sample solution approach:

- Identify the known variables.
- Determine the appropriate formula.

- Plug in the values and compute.
- Interpret the result in context.

Risk and Return

The solutions illustrate calculating expected returns and measuring risk through metrics like variance and standard deviation:

- Expected Return: $E(R) = \sum p_i \times R_i$
- Variance: $\sigma^2 = \sum p_i \times (R_i - E(R))^2$

These calculations help in understanding investment attractiveness and portfolio diversification.

Cost of Capital

The solutions guide students through calculating the weighted average cost of capital (WACC):

$$WACC = \frac{E}{V} \times R_e + \frac{D}{V} \times R_d \times (1 - T_c)$$

where:

- E = Equity value
- D = Debt value
- V = Total value ($E + D$)
- R_e = Cost of equity
- R_d = Cost of debt
- T_c = Corporate tax rate

Step-by-step, the manual demonstrates how to estimate each component accurately.

How the Solutions Enhance Learning and Application

calculations and decision-making tools.
