- Signal Processing Circuitry:

The received RF signals are fed into a bandpass filter to isolate the frequencies used by mobile phones. Amplifiers boost weak signals for better detection.

- Detection Circuit:

Detectors utilize components like diodes or specialized ICs (integrated circuits) to identify the presence of RF signals. Some circuits employ mixers or superheterodyne circuits for better sensitivity.

- Alarm or Indicator System:

Once a signal is detected, the circuit triggers an indicator such as LED lights, buzzers, or digital displays to alert the user.

Sample Detection Steps:

- The detector scans the designated frequency bands
- If a signal above a certain threshold is detected, it activates the alert
- The user can then locate the source of the signal, often by moving the detector around the area

Illustrative Components:
