Key Topics in Chemistry Inquiry and Their Answers

Atomic Structure and Periodic Table

What is an atom?

An atom is the smallest unit of an element that retains its chemical properties. It consists of a nucleus containing protons and neutrons, surrounded by electrons in orbitals.

How are elements organized in the periodic table?

Elements are arranged based on increasing atomic number into periods (rows) and groups (columns) with similar chemical properties. The periodic table reflects periodic trends such as electronegativity, atomic radius, and ionization energy.

Chemical Bonding

What causes atoms to bond?

Atoms bond to achieve a stable electron configuration, often fulfilling the octet rule. Bonding results from electrostatic attractions between electrons and nuclei.

Types of bonds

- Ionic bonds: Transfer of electrons between metals and nonmetals.
- Covalent bonds: Sharing of electrons between nonmetals.
- Metallic bonds: Delocalized electrons in metal atoms.

Chemical Reactions and Equations

How do you balance a chemical equation?

Balance equations by ensuring equal numbers of each atom on both sides. Use coefficients rather

than subscripts to adjust atom counts.

What are types of chemical reactions?

- Combination (synthesis)
- Decomposition
- Single replacement
- Double replacement
- Combustion

States of Matter and Solutions

What are the main states of matter?

Solids, liquids, gases, and plasma, each with distinct particle arrangements and properties.
