Answer: $1s^2 2s^2 2p^6 3s^2 3p^4$

2. Periodic Table and Periodic Trends

Students should understand trends such as atomic radius, ionization energy, electronegativity, and electron affinity across periods and down groups.

- **Atomic Radius:** Decreases across a period, increases down a group.

- **Ionization Energy:** Increases across a period, decreases down a group.
- **Electronegativity:** Higher across a period, lower down a group.

Sample Question:

Which element has the highest electronegativity among nitrogen, oxygen, fluorine, and neon?

Answer: Fluorine

3. Chemical Bonding and Molecular Geometry

Bonding theories, including ionic and covalent bonds, and VSEPR theory for molecular shapes, are crucial components.

- **Ionic Bonds:** Formed between metal cations and non-metal anions.
- **Covalent Bonds:** Sharing of electron pairs between non-metal atoms.
- **VSEPR Theory:** Predicts molecular shapes based on electron pair repulsion.

Sample Question:

Predict the molecular shape of methane (CH₄).

Answer: Tetrahedral

4. Intermolecular Forces

Understanding forces such as hydrogen bonding, dipole-dipole interactions, and London dispersion forces is essential for explaining physical properties.

- **Hydrogen Bonding:** Strong dipole-dipole attraction involving hydrogen and highly electronegative atoms (N, O, F).
- **London Dispersion Forces:** Present in all molecules; responsible for nonpolar compound interactions.

Sample Question:

Which intermolecular force is primarily responsible for the high boiling point of water?

Answer: Hydrogen bonding

Sample Practice Problems with Answers from GPB Chem 203 Unit 2

Providing practice problems with solutions is an excellent way to prepare for tests. Below are some typical questions and their answers.

Problem 1: Electron Configuration and Periodic Trends

Question:

Calculate the electron configuration of magnesium (Mg) and explain its position in the periodic table based on its properties.

Answer:

Magnesium (atomic number 12) electron configuration: $1s^2 2s^2 2p^6 3s^2$

Position: Group 2 (alkaline earth metals), period 3. Magnesium has a relatively low ionization energy and moderate electronegativity, characteristic of metals in group 2.

Problem 2: Bonding and Molecular Geometry

Question:

Draw the Lewis structure for carbon dioxide (CO_2) and determine its molecular geometry.

Answer:

Lewis structure: $O=C=O$ with double bonds between carbon and each oxygen atom.

Molecular geometry: Linear, with a 180° bond angle due to the sp hybridization of carbon.

Problem 3: Intermolecular Forces and Physical Properties

Question:

Explain why CO_2 is a gas at room temperature, despite being a polar molecule.

Answer:

CO_2 is a nonpolar molecule overall because of its linear symmetry, which cancels out dipole moments. Its molecules are held together by London dispersion forces, which are relatively weak,

leading to gaseous state at room temperature.
