Typical Practical 2 Experiments and Procedures

Below are detailed descriptions of commonly performed experiments in Practical 2, including objectives, materials, procedures, and expected outcomes.

Experiment 1: Investigating the Effect of Light Intensity on Photosynthesis

Objective: To determine how different light intensities affect the rate of photosynthesis in aquatic plants.

Materials:

- Elodea (or similar aquatic plant)
- Test tubes
- Sodium bicarbonate solution
- Light source (lamp)
- Ruler or measuring scale
- Stopwatch
- Dark room or controlled environment

Procedure:

- Place a few Elodea leaves in a test tube filled with sodium bicarbonate solution.
- Position the light source at varying distances (e.g., 10cm, 20cm, 30cm) from the test tube.
- Turn on the light and measure the rate of oxygen bubble formation over a fixed period.
- Record the number of bubbles produced at each light intensity.
- Repeat the experiment to ensure accuracy.

Expected Results: Increased light intensity should correlate with higher rates of photosynthesis, evidenced by more oxygen bubbles.

Experiment 2: Effect of Temperature on Enzyme Activity

Objective: To observe how different temperatures influence enzyme activity.

Materials:

- Fresh potato extract (rich in amylase)

- Starch solution
- Iodine solution
- Test tubes
- Water baths set at different temperatures (e.g., 0°C, 20°C, 40°C, 60°C)
- Pipettes

Procedure:

- Incubate potato extract in water baths at designated temperatures for 5 minutes.
- Add the enzyme extract to starch solution and incubate in the same water bath.
- After incubation, add iodine to the mixture.
- Observe color change: a disappearance of blue-black indicates starch breakdown.
- Record the time taken for starch to be completely digested at each temperature.

Expected Results: Enzyme activity increases with temperature up to an optimum point, after which it declines due to enzyme denaturation.
