- Radius and Ulna (forearm bones)
- Femur

#### Example 2: Functions of the Respiratory System

Question: Explain how oxygen is transported from the lungs to body tissues.

Answer Key:

Oxygen diffuses from the alveoli in the lungs into the blood capillaries. Hemoglobin molecules in red blood cells bind oxygen, forming oxyhemoglobin. The oxygen-rich blood is then pumped by the heart through arteries to body tissues, where oxygen is released for cellular use.

#### Example 3: System Interactions

Question: How do the respiratory and circulatory systems work together during respiration?

Answer Key:

The respiratory system facilitates gas exchange in the lungs, where oxygen enters the blood and carbon dioxide is expelled. The circulatory system transports oxygenated blood from the lungs to tissues and returns deoxygenated blood to the lungs for gas exchange, ensuring a continuous

supply of oxygen and removal of waste gases.

### Common Misconceptions and Clarifications

- Misconception: The heart is part of the respiratory system.

Clarification: The heart is part of the circulatory system, which works closely with the respiratory system but is a distinct entity.

- Misconception: Muscles can contract without signals from the nervous system.

Clarification: Muscle contractions are initiated by electrical signals from the nervous system, specifically motor neurons.

- Misconception: The digestive system absorbs all nutrients directly into the bloodstream.

Clarification: Nutrients are absorbed mainly in the small intestine, then transported via the circulatory system.

### Conclusion and Final Tips

The body systems challenge answer key is an invaluable tool to deepen your understanding of human anatomy.
